## OVERVIEW

The CF5705 series is a low-current analog watch stepping motor driver CMOS IC with built-in 32.768 kHz crystal oscillator circuit.

## FEATURES

- 32.768 kHz crystal oscillator circuit $\mathrm{C}_{\mathrm{G}}$ and $\mathrm{C}_{\mathrm{D}}$ built-in
- -3.6 to -1.2 V operating supply voltage range
- Operating current consumption
- $\mathrm{V}_{\mathrm{SS}}=-1.55 \mathrm{~V}, \mathrm{C}_{\mathrm{D}}=16 \mathrm{pF}: 250 \mathrm{nA}$ (max)
- $\mathrm{V}_{\mathrm{SS}}=-2.8 \mathrm{~V}, \mathrm{C}_{\mathrm{D}}=26 \mathrm{pF}: 1000 \mathrm{nA}$ (max)

Note: Current consumption depends on the built-in capacitor.

- Reset function

4 Hz and subsequent frequency dividers are reset

## FUNCTIONAL DESCRIPTION

## Motor Output Waveform

The motor output waveform cycle time and output pulsewidth are set by mask option.

## Reset Function

## Reset operation

A reset operation occurs when RESET is held HIGH $\left(V_{D D}\right)$ for a period of 93.75 ms or greater, otherwise
the reset is ignored. When the reset pulse is valid, the 4 Hz and subsequent frequency dividers are reset.

## Reset Release

When the reset is released, the first output pulse occurs on the output pin opposite the output pin where the preceding motor drive output pulse occurred; first pulse occurs on OUT1 if previous
motor drive pulse occurred on OUT2, and vice versa. A delay of $\mathrm{T}_{\mathrm{CY}} / 2-0.125$ to $\mathrm{T}_{\mathrm{CY}} / 2$ takes place from when reset is released until the first output pulse occurs.

## Test Function

## Normal mode (TEST = open circuit)

In test mode, a 512 Hz rectangular wave is output on TEST. Note that the output load (probe) must be greater than $10 \mathrm{M} \Omega$ and less than 20 pF . The motor

## Test mode 1 (TEST = $\mathrm{V}_{\mathrm{DD}}$ )

Test mode 1 is invoked when TEST is held HIGH for a minimum of 2 cycles of the 512 Hz clock ( $\mathrm{T}_{\mathrm{CH}}>3.9 \mathrm{~ms}$ ), otherwise it is ignored. In test mode

## Test mode 2 (TEST = $\mathbf{V S S}_{\text {S }}$ )

Test mode 2 is a dedicated IC test mode. In test mode 2 , the device operates at 32 -times speed, with the supply voltage connected directly to the oscillator circuit. Note that if a reset input occurs, the internal
drive outputs on OUT1 and OUT2 continue to operate normally.

1, high-speed motor output operation occurs, with the cycle time set by mask option to 62.5 or 125 ms .
operation is reset and device output stops. Once operation stops, normal operation is not restored until TEST is either open circuit or goes LOW.
